Outline

- ▶ Background
- ▶ Scan-based attacks
- ▶ Elliptic curve cryptosystem(ECC)
- ▶ Scan-based attack against ECC
- ▶ Experiments and results
- ▶ Conclusion

Background – Cryptosystem LSI –

Background – Cryptosystem LSI –

Background – Symmetric vs. Public –

- ▶ Symmetric-key cryptosystem: DES, AES

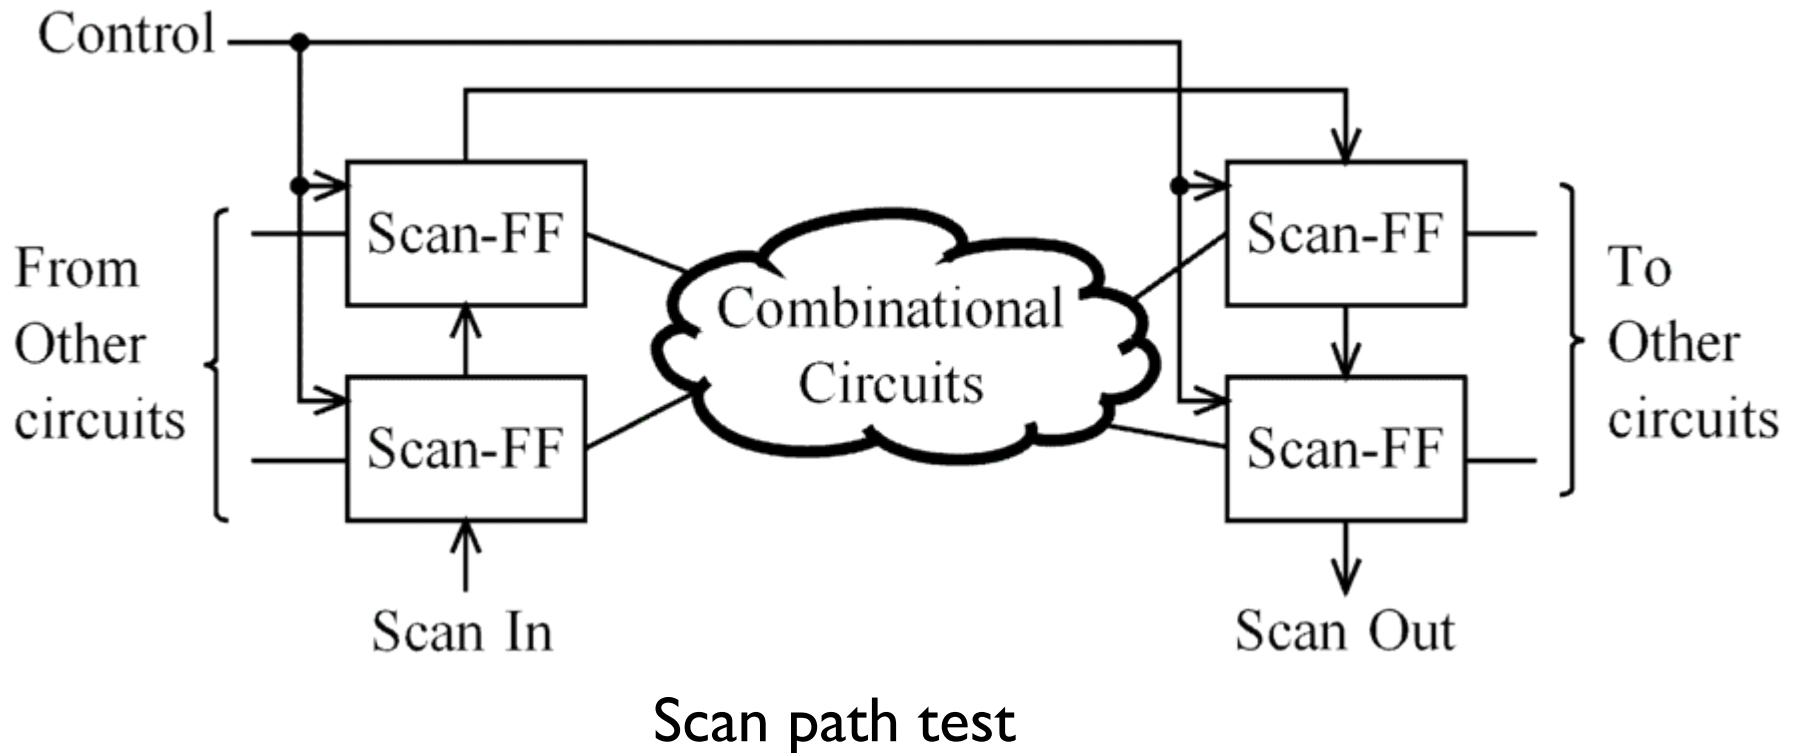

- ▶ Public-key cryptosystem: RSA, **ECC***

***ECC: Elliptic curve cryptosystem**

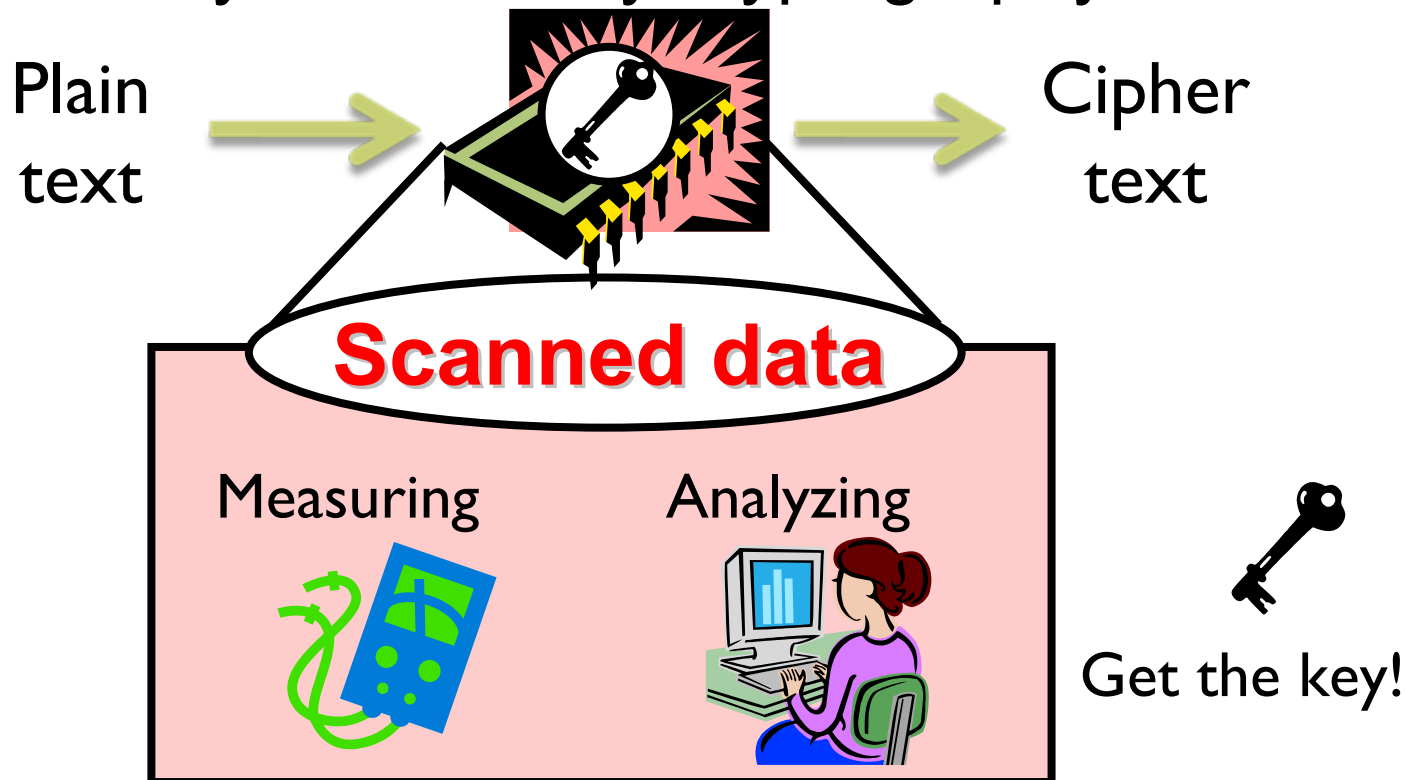

Background – Scan path test –

- ▶ High test efficiency
- ▶ Easy to implement

Scan-based attacks against DES[1] and AES[2,3]

Symmetric-key cryptography

Purpose of our presentation

Scan-based attack
against
elliptic curve cryptosystem

Elliptic curve cryptosystem

► Basic operation

$$Q = P_1 + P_2$$

$$Q = 2P$$

Elliptic curve cryptosystem: $Q=kP$

► Montgomery's method [15]

$$k = (\underbrace{k_{m-1} k_{m-2} \dots k_{i+1}}_{*l} \boxed{k_i} \dots k_1 k_0), k_j \in \{0, 1\}$$

$$[lP, (l+1)P] \begin{cases} \rightarrow [2lP, (2l+1)P] & \text{if } k_i=0 \\ \rightarrow [(2l+1)P, 2(l+1)P] & \text{if } k_i=1 \end{cases}$$

$$*l = k_{m-1} k_{m-2} \dots k_{i+1}$$

$k_3=1$	$P, 2P$	
$k_2=1$	$3P, 4P$	$P+2P = 3P, 2 \times 2P = 4P$
$k_1=0$	$6P, 7P$	$2 \times 3P = 6P, 3P+4P = 7P,$
$k_0=1$	$13P, 14P$	$6P+7P = 13P(1101_2P), 2 \times 7P = 14P$

[15] P. L. Montgomery, Mathematics of Computation, 1987.

Intermediate values vs. secret key $k[18]$

If $k = (\underbrace{k_{m-1} k_{m-2} \dots k_{i+1}}_{\text{already-known}} \boxed{k_i} \dots k_1 k_0)$, $k_j \in \{0, 1\}$
unknown

iff $k_i = 0$, $V(i)P \in$ a set of intermediate values

$$V(i)P = \left(\sum_{j=i}^{m-1} k_j 2^{j-i+1} + 1 \right) P$$

$$\mathbf{k_i \Leftrightarrow V(i)P}$$

[18] L. Goubin, PKC, 2003.

Sample

Intermediate values $V(i)P$ (4 bits)

k_3	I							
k_2	5P				7P			
	0(10)				1(11)			
k_1	9P		11P		13P		15P	
	0(100)		1(101)		0(110)		1(111)	
k_0	8P	9P	10P	11P	12P	13P	14P	15P
	1000	1001	1010	1011	1100	1101	1110	1111

P, 2P
3P, 4P
6P, 7P
13P, 14P

1. $k_3 = 1$
2. $V(2)P = \underline{5P}$ does not exist $\rightarrow k_2 = 1$
3. $V(1)P = \underline{13P}$ exists $\rightarrow k_1 = 0$
4. $k_0 = 0?$ or $k_0 = 1?$ $\rightarrow \underline{13(1101)P}$

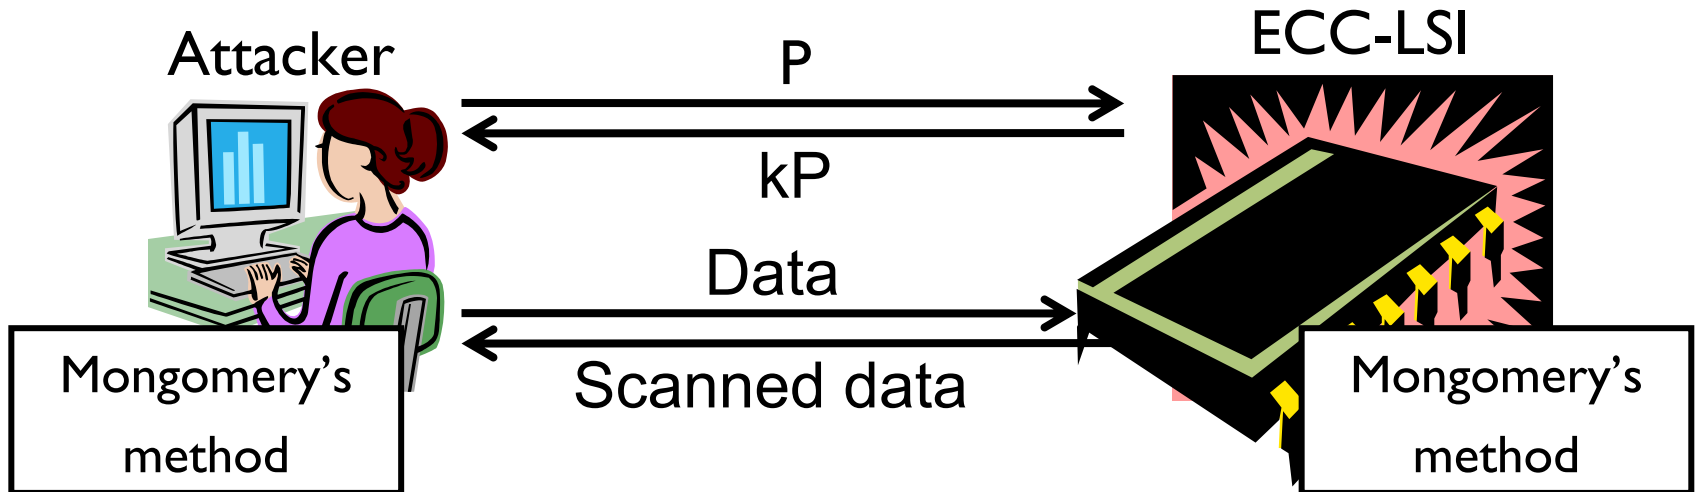

How to find the intermediate values?

- ▶ Problem 1: Which registers store intermediate values?
- ▶ Problem 2: When do intermediate values appear?

Assumption

- ▶ Attackers can
 - ▶ compute kP with any P by using an ECC LSI
 - ▶ access the scan path
- ▶ Known
 - ▶ kP algorithm used in an ECC LSI (e.g. Montgomery's method)

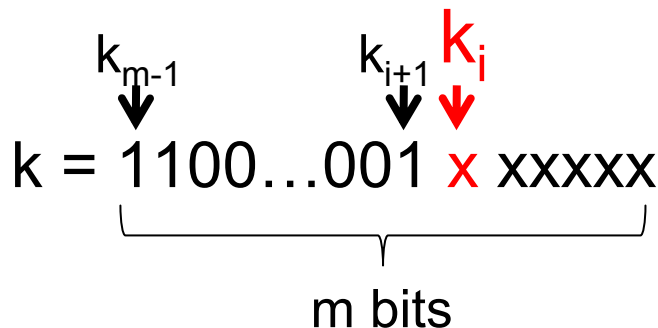

Proposed method

- ▶ **Discriminator to $V(i)P$ erated from l -bit register value**

l -bit register is

- ▶ Independent of the connection of registers
- ▶ Independent of timing

Let's find k_i !

D_i : Discriminator to $V(i)P$

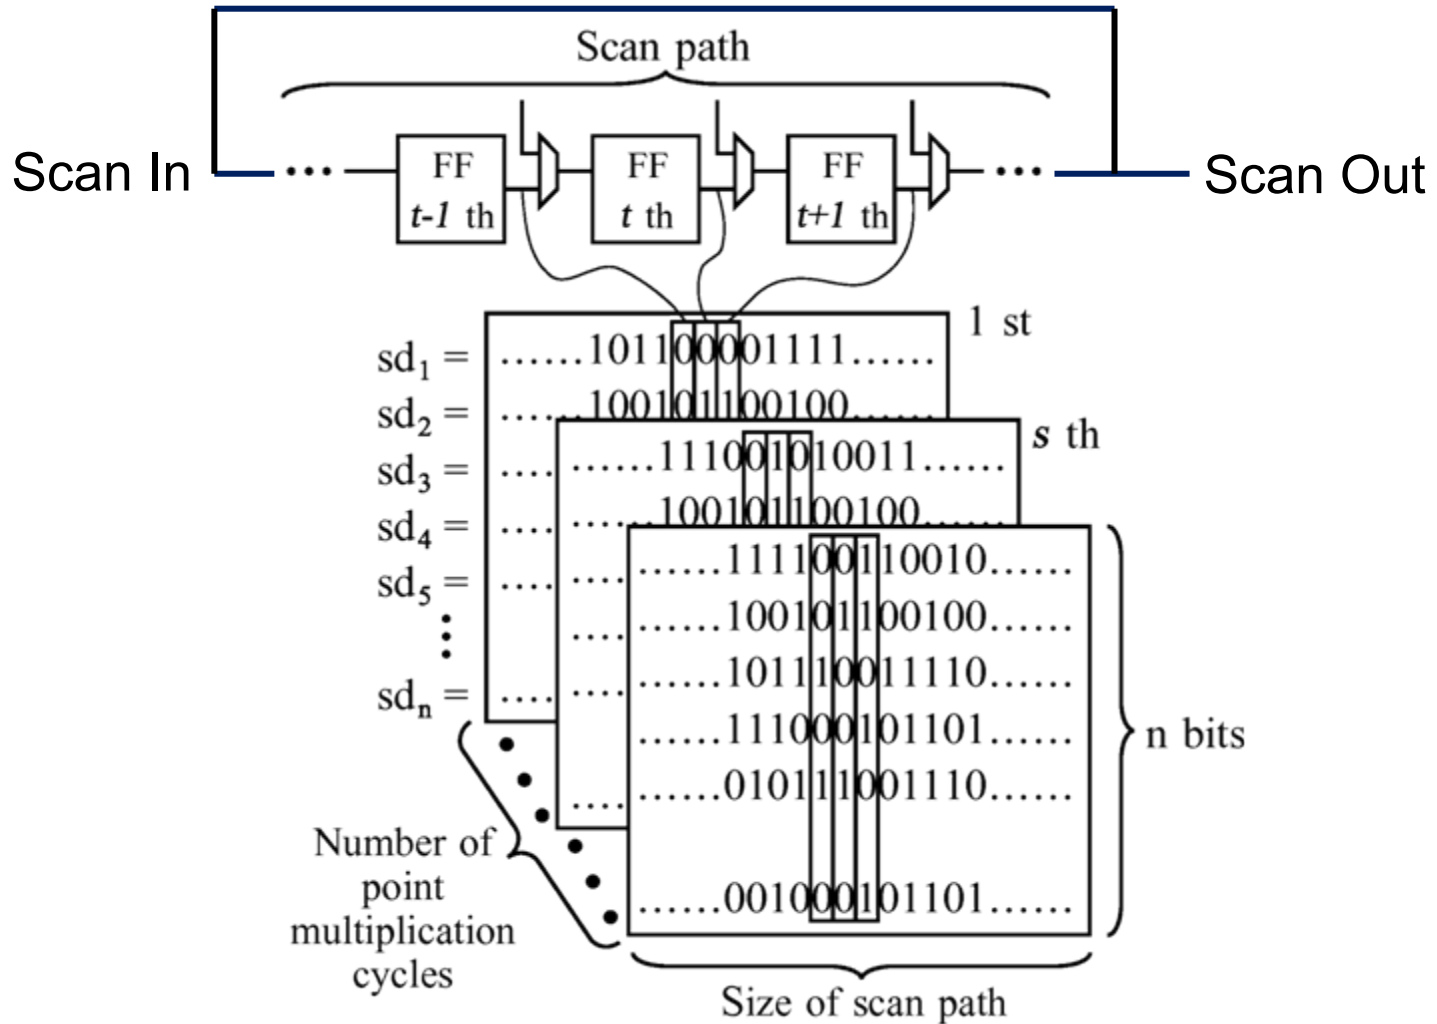

Input: $P_r \in E(\mathbb{F}_2^m)$ ($1 \leq r \leq n$), $V(i)$

Output: Discriminator D_i

$$\begin{array}{cccccccc}
 V(i)P_1 & = & 0 & 1 & 0 & \dots & 1 & 0 & 1 & 1 & \dots & 1 \\
 V(i)P_2 & = & 1 & 1 & 0 & \dots & 1 & 1 & 0 & 1 & \dots & 0 \\
 V(i)P_3 & = & 1 & 1 & 0 & \dots & 0 & 1 & 0 & 1 & \dots & 1 \\
 V(i)P_4 & = & 0 & 1 & 1 & \dots & 0 & 1 & 1 & 0 & \dots & 0 \\
 V(i)P_5 & = & 1 & 0 & 1 & \dots & 1 & 1 & 1 & 1 & \dots & 0 \\
 \vdots & & \vdots & & \vdots & & & \vdots & & & & \\
 V(i)P_n & = & 0 & 1 & 0 & \dots & 0 & 1 & 0 & 1 & \dots & 0
 \end{array}
 \left. \vphantom{\begin{array}{c} \\ \\ \\ \\ \\ \\ \\ \end{array}} \right\} D_i \text{ (n bits)}$$

$$\underbrace{\hspace{15em}}_{2m \text{ bits}}
 \begin{array}{ccc}
 \underbrace{\hspace{10em}}_{y\text{-coordinate}} & & \underbrace{\hspace{10em}}_{x\text{-coordinate}}
 \end{array}$$

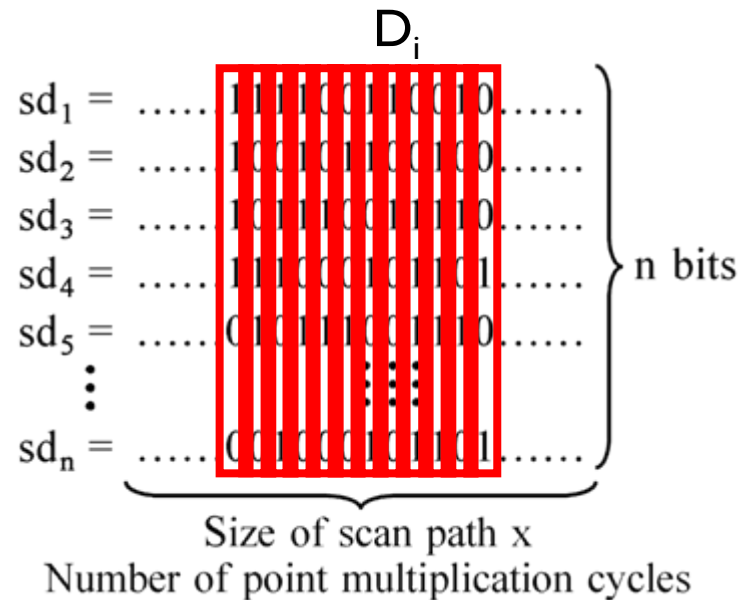

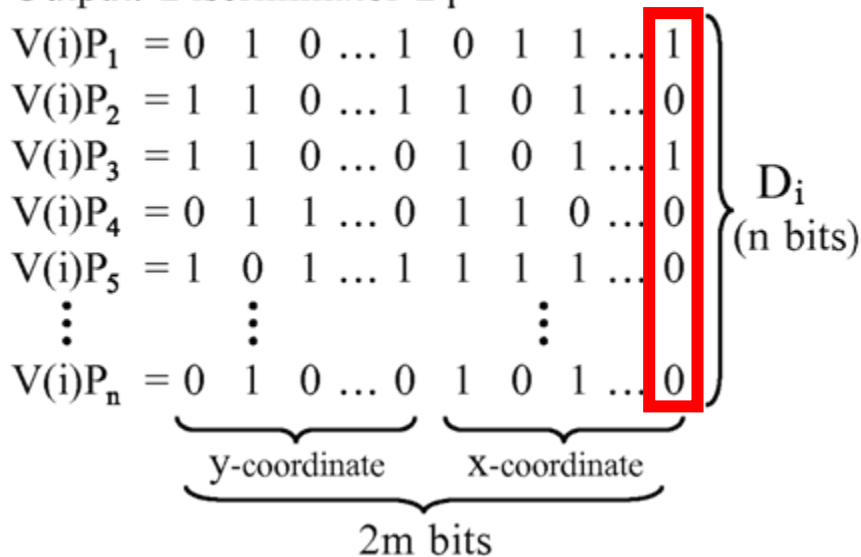

Scanned data

D_i exists?

Input: $P_r \in E(F_{2^m})$ ($1 \leq r \leq n$), $V(i)$

Output: Discriminator D_i

D_i exists $\Leftrightarrow k_i=0$

D_i does not exist $\Leftrightarrow k_i=1$

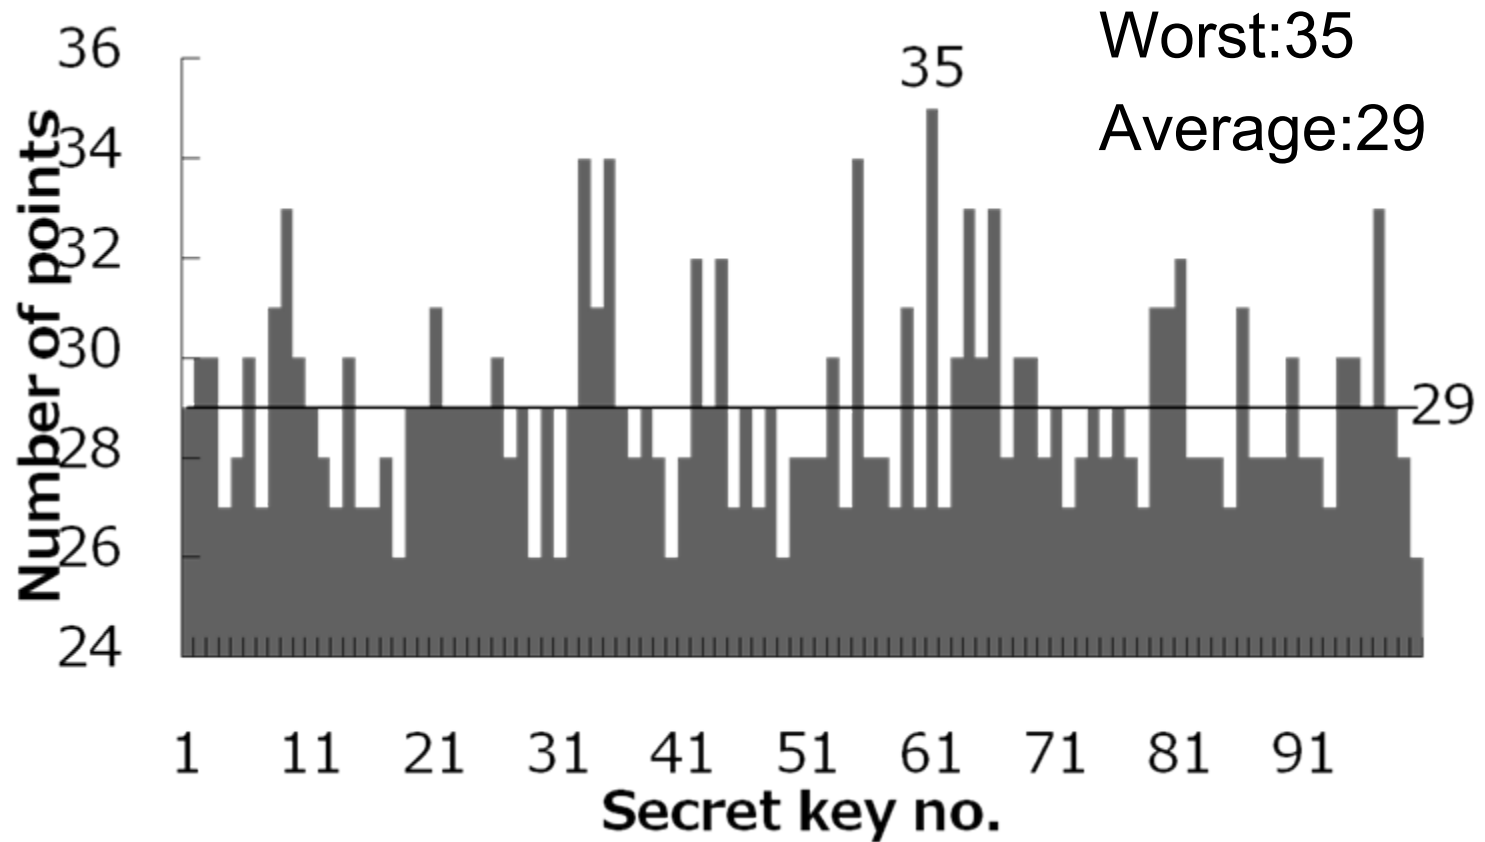

Experiments

- ▶ Key length: **163** bits
- ▶ Size of scan path: **2,520** bits
- ▶ $Q=kP$: **15,137** cycles

ECC-LSI architecture

Results

Conclusion

- ▶ **Scan-based attack** against **elliptic curve cryptosystem**
- ▶ Deciphering a secret key k
at **40 seconds** by using **29 input**

Future works

- ▶ Attacks :
 - Method for accessing scan path
 - Compactor
- ▶ Defense :
 - Efficiency defense method
